

YouMonitor.us Website Monitoring Service

Give you industrial-strength website monitoring with up-to-the-minute information about how people from all over the world see your website.

About YouMonitor.us

We're a team of engineers and designers, passionate about a simple idea; that the web can be a collaborative place where website owners keep an eye on each other's websites and report when a problem happens. The software to do this didn't exist, so we built it, and the community that's become **YouMonitor.us** was born.

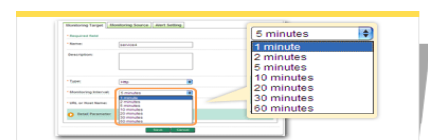

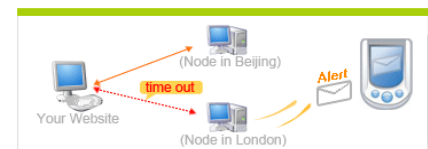

Of course, YouMonitor.us is our URL, but it's only half the story. It's really "**You monitor us, and we'll monitor you!**" But that would never have worked as a URL!

With YouMonitor.us, everyone monitors each other, and when your site is down or slow to respond, you'll know about it right away. That knowledge means your site visitors or customers will spend less time wondering what happened to your site and more time buying from your store, or interacting with the life you've built for yourself on the web.

Benefits and Features of YouMonitor.us

If you choose our service, we will get:

- We currently have over a hundred monitoring sources. You can select the source from which you want your website monitored.
- Once your website is unreachable or response times become abnormal, we will send you an email or SMS
- We provide professional reports for your website that will help you to analyze, resolve and maintain your website.
- You can select how often YouMonitor.us checks your website. We have monitoring intervals from one minute up to an hour.

How YouMonitor.Us Works

Overview

YouMonitor.Us customers select the monitoring intervals and choose from which geographic regions they wish to be monitored. If your site or services become inaccessible, response times or performance becomes abnormal, an email, SMS text message, alert will be sent to notify you instantly.

Details

YouMonitor.Us is a free, participation-based network, where customers receive monitoring services and participate as active nodes in the YouMonitor.Us network, performing intermittent low-bandwidth and highly-secure testing routines on other participants.

Anybody can join and participate in the network. No matter how big or small your website. Even if you run a tiny blog on a shared server, you can participate and reap the benefits of global monitoring.

Once registered, the web site owner verifies a few simple questions through our customization wizard and then installs a tiny piece of open-source code into their website or server. The code, called **DC-Hand**, is the heart of the YouMonitor.Us service and is supported by popular web programming languages like **ASP** on Windows, **JSP/Java/J2EE** on Linux/Unix, **PHP** on Windows, Linux/Unix, and **Perl** on Linux/Unix.

Once **DC-Hand** is installed, activated, and verified by YouMonitor.Us, you're done! You can immediately begin to monitor your website and its services through the YouMonitor.Us admin page, set up your Service Level Thresholds, configure your Alerts, view reports, analyze network accessibility trends and a whole lot more.

More about DC-Hand and what it does:

The DC-Hand code script resides on your web site or servers. DC-Hand is open-source and free to deliver or distribute in accordance with open-source policy.

The protocol between DC-Node and DC-Brain (essentially the network control and coordination point) is an open and published protocol.

The protocol between DC-Nodes (node-to-node communication, between customers and monitoring points) is also an open and published protocol.
