## Notes on Ben-Stove with tripod without weld

The documentation of the efficient fuelwood stoves Ben 2 and Ben 3 was published as Open Source in 2016 by Solar Cookers International in English: http://solarcooking.org/ben
...and Fundación Terra (in Spanish)
https://www.terra.org/categorias/articulos/hornillos-de-lena-ben-2-y-ben-3-de-dieter-seifert .
In August 2019, the author received a note from Sri Lanka, which suggests a modified construction of the tripod. The tripod elements made of steel strip are fastened to the furnace shell by screws, so that no welding is necessary. The essential parts of the Ben-Stove are maintained. We will name it "Ben SL". The parts of an example of Ben SL are described in the parts list (given below) and shown in the two drawings (Fig. 1 and 2, page 2).

Fig. 1 shows Ben-SL in section with a pot (left) and a pan. Fig. 2 is a top view. Shown are: the ash pan (1) with the built-in hairpin-shaped fire grate bars (2), the furnace shell (3), which is divided into two halves. The newly proposed tripod parts (4) are fastened to the furnace shell with two screws M6 x 15 (6) each.

The bottom edge of the furnace shell (3) is 30 mm from the ground, so that the fire on the grate (2) is supplied with primary and secondary air unhindered. The diameter of the furnace shell results from the pot diameter $D$ and the double gap width 2 s . The gap width s is advantageously 7 to 10 mm .

The most favorable distance of the pot from the furnace grid (2) depends on the fuel (especially on the flame length). Therefore, the furnace shell height $H$ and the length $L$ of the tripod have to be optimized experimentally.

The contribution from Sri Lanka is a good example of the opportunities for cooperation with the open source principle for finding appropriate solutions.
