

# **FATHER HIMALAYA SOLAR FURNACES: OPTICAL PRINCIPLES, TECHNOLOGIES, AND LINEAGE**

**Jean-Jacques Serra<sup>1</sup>, Jacinto Rodrigues<sup>2</sup>**

**1: Association des Amis de Padre Himalaya,  
6 Rue du veinat, 66690 Sorede, France**

**2: Professor emeritus, University of Porto,  
Rua da Fontela, 90A, Gandra, 4740-476 Esposende, Portugal**

Second International Conference  
**CONSOLFOOD2018**  
22-23-24 January 2018 - Faro, Portugal

# From Arcos de Valdevez to Coimbra

- **Manuel Antonio Gomes**
- 1868: Born in Cendufe (hamlet of Arcos de Valdevez)
- Seminary in Braga (nicknamed "Himalaya") → 1891
- College professor, rector in Coimbra
- College chaplain in Porto

# Scientific goal

- ◆ **Farming yield increase**
- **Synthesis of nitrogenous fertilizing compounds from atmosphere components**
  
- ❖ **High temperature process**
  - ① **Electric arc** (Crookes, 1892)
  - ② **Solar concentration**
  
- ❖ **Travel to Paris**
- **Education at *Collège de France***  
(free higher education, but without diploma)

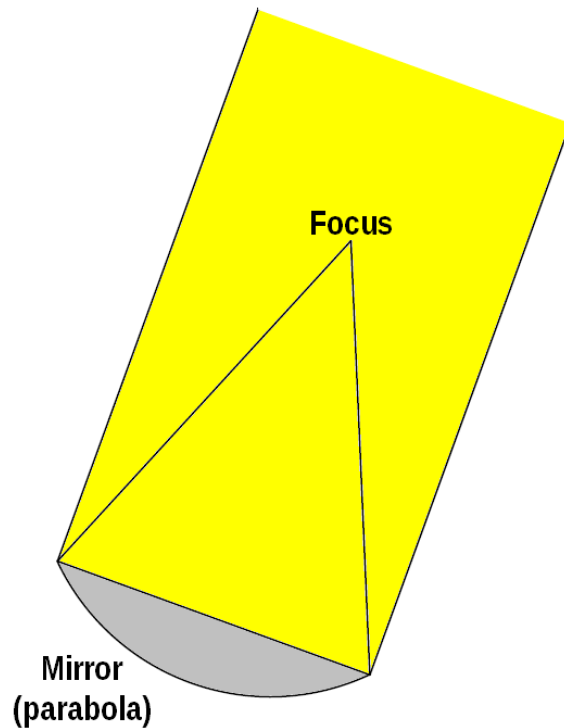

" Les Amis du  
Padre Himalaya  
de Sorede"

Second International Conference  
**CONSOLFOOD2018**  
22-23-24 January 2018 - Faro, Portugal

# State of the art

- **Burning mirrors**

- Focus not easily accessible
- Risks of molten materials falling down on the mirror

- **Burning lenses**

- High absorption on thick lenses
- ◆ ? MAG never mentions stepped lenses (Fresnel lenses)

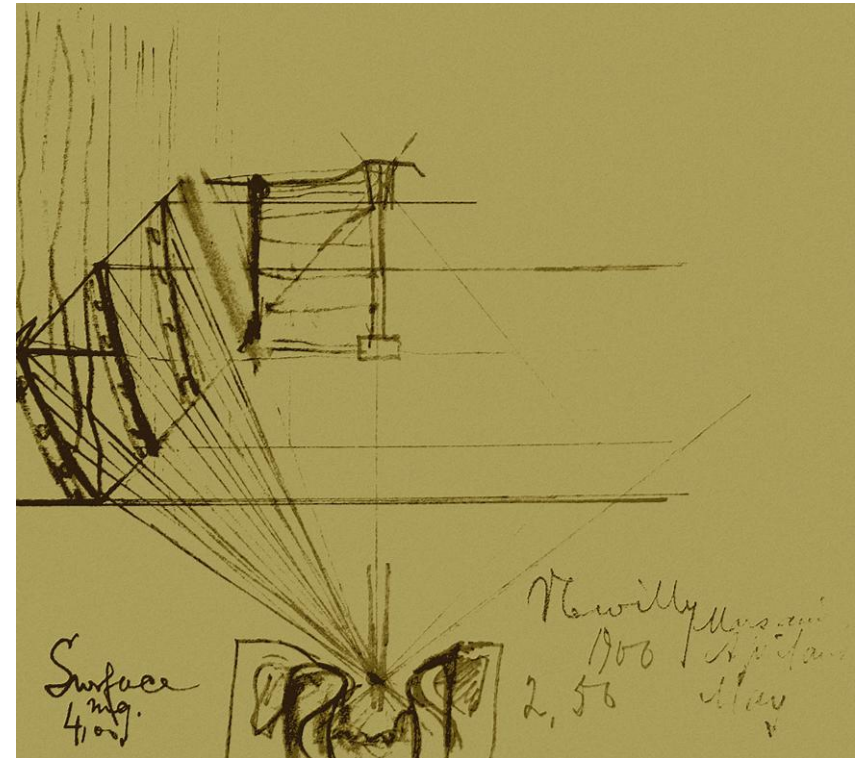

" Les Amis du  
Padre Himalaya  
de Sorede"

# First generation solar furnaces: Metallic lenses

- Principle

- First prototype (1899)

- Diameter  $\approx 2.5$  m; Aperture  $\approx 4$  m<sup>2</sup>
- Tested March-May 1900, Neuilly (49°N)
- Fusion of lead and zinc
- Estimated temperature  $\approx 500^\circ\text{C}$

# Patent n°292.360, 7<sup>th</sup> September 1899

## Conical mirrors for manufacturing simplification

- Remark#1: Controlled atmosphere enclosure
- Remark#2: Variable step and/or length for conical mirrors

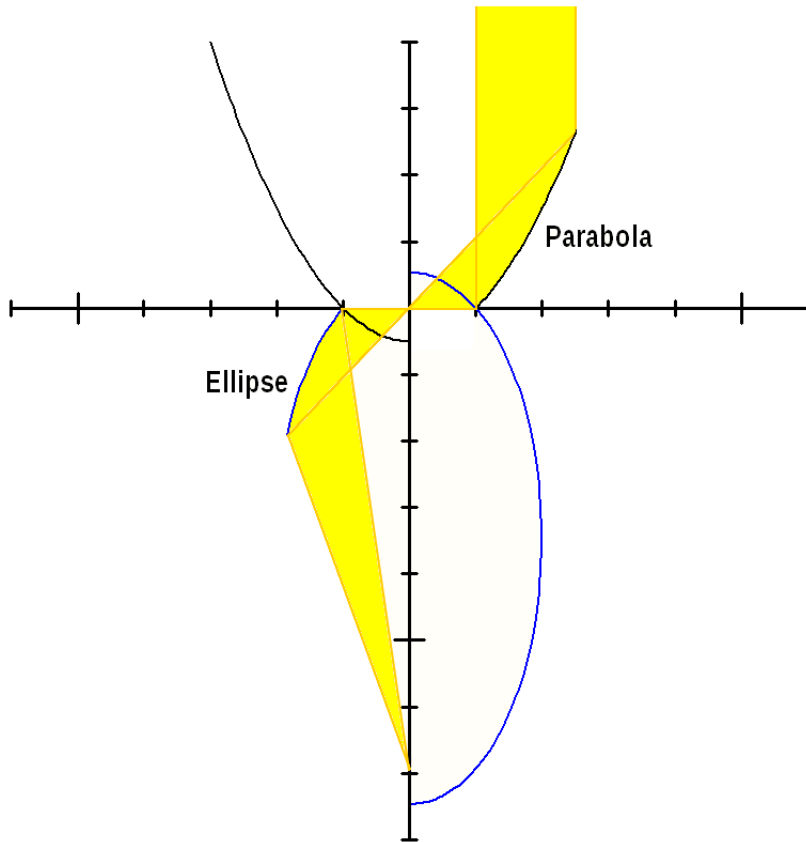

" Les Amis du  
Padre Himalaya  
de Sorede"

Second International Conference  
**CONSOLFOOD2018**

# Diabolo-type concentrator

Conical mirrors for manufacturing simplification

" Les Amis du  
Padre Himalaya  
de Sorede"

Second International Conference  
**CONSOLFOD2018**  
22-23-24 January 2018 - Faro, Portugal

# Industrial size solar furnace: Summer 1900

- Diameter  $\approx 5$  m; Aperture  $\approx 20$  m<sup>2</sup>
  - 14 truncated cones + 2 "diabolos"
  - Copper alloy faceted mirrors
  - Azimutal mounting
- 
- Controlled atmosphere enclosure (inert or vacuum)

- Tested July-September 1900, Sorède (42.5°N)
- Fusion of aluminum, not copper
- Estimated temperature  $\approx 900^{\circ}\text{C}$

" Les Amis du  
Padre Himalaya  
de Sorède "

# Second generation solar furnaces: Off-axis parabola

Patent n°307.699, 31<sup>st</sup> January, 1901

+ complement, 29<sup>th</sup> Januray, 1902

" Les Amis du  
Padre Himalaya  
de Sorede "

Second International Conference  
**CONSOLFOD2018**  
22-23-24 January 2018 - Faro, Portugal

## 2<sup>nd</sup> generation, 1<sup>st</sup> version: Spring 1902

- Aperture  $\approx 60 \text{ m}^2$
- Reflective area  $\approx 80 \text{ m}^2$
- Copper alloy faceted mirrors
- Azimutal mounting

### 1) Inauguration: Lisbon (38°N)

- Partial destruction, Crucible collapse

### 2) Main results

- Fusion of iron oxide, silica, quartz, basalt, granite, glass, firebrick [but not lime, chalk or magnesia]
- Estimated temperature  $\approx 2000^\circ\text{C}$

Not only did Father Himalaya succeed in reducing oxide of iron, silica, quartz, basalt, granite, glass and firebrick to a liquid state, but the plumbago crucible which held the minerals yielded to the heat and mixed like water with the iron and silica. The melting of the plumbago crucible was beyond the cleric wizard's expectations. The 3,632 degrees of sun heat, however, were powerless to melt lime, chalk or magnesia.

## 2<sup>nd</sup> generation, 2<sup>nd</sup> version: Pyrheliophor

- Aperture  $\approx 60 \text{ m}^2$
  - Reflective area  $\approx 80 \text{ m}^2$
- Trapeze: 10.5 m (top) x 5.4 m (bottom)  
10.5 m (height)

- Equatorial mounting
- Sun tracking thanks to a clock

**First solar furnace  
automatically  
orientated !**

22-23-24 January 2018 - Faro, Portugal

## 2<sup>nd</sup> generation, 2<sup>nd</sup> version: Pyrheliophor

- Reflective area  
Large copper alloy mirrors replaced by 6117 small glass mirrors  
Size: 123 x 98 mm
- Mean focal length:  $\approx 10$  m
- Focus diameter:  $\approx 15$  cm
- Crucible: 45 cm in diameter, 60 cm deep  
Lined with magnesia

" Les Amis du  
Padre Himalaya  
de Sorede "

Second International Conference  
**CONSOLFOOD2018**  
22-23-24 January 2018 - Faro, Portugal

## 2<sup>nd</sup> generation, 2<sup>nd</sup> version: Pyrheliophor

- **World's Fair, St. Louis, April 30 - December 1<sup>st</sup>, 1904**
- Construction & adjustment duration: 5 months
- Fusion: iron (<1 min),  
fire-clay (≈3 min),  
magnesia (≈20 min)
- Estimated temperature: 3800°C

**E**NCOURAGED by American scientists and the highest awards at the World's Fair—the grand prize, two gold and a silver medal—Father A. M. G. Himalaya, the inventor of the pyrheliophor or solar apparatus, has taken up his residence at Washington, D. C.

- **Pyrheliophor destroyed on St. Louis site, or during the return trip to Europe ?**

# Conclusion

- **1899-1904: 5 years of research and development with the aim of obtaining ultra-high temperatures by means of concentrated solar energy**
  - ◇ **industrial scale**
  - ◇ **easy to use**
  - ◇ **several innovative concepts**
- ◇ **In 1904, the "pyrheliophor" was the larger solar furnace in the world, the first to be automatically orientated.**
