

20210902 **Hugis ng Buhay**
Viktor Nonong Medrano

May repetisyon sa mga hugis ng mga bagay sa ating Sansinukob. Isip kong sa iba-ibang mundong ang hugis ng mga parang hayop ay parang kabayo, ibon, o tao man. May mga hugis nang parang punò o kabute. May pantasya akong mga parang taong ang balat ay **berde** o **bughaw**. Isip kong baka nga mayroon sa malayong-malayo. Isip kong kahit na ang dahilan ay *panspermia* o mga independenteng *abiogenesis*, may repetisyon ang hugis ng buhay na bagay. Kahit na parang bakterya o parang *virus* lamang ang buhay sa ibang mundo, parang mahika na rin, marahil "dulo ng tipak ng yelo sa dagat" бага. Sana'y makita ko ang ibang buhay. Nawa'y madiskubre ng mga dalub-agham.

20210815 **Hope Is Life outside Earth**

Viktor Nonong Medrano

I opine that real hope lies in life beyond our Earth. If a great war destroys us, a bigger pandemic kills us, an asteroid strikes us, or a comet hits us, and if there is life outside Earth, as is mathematically probable, then there is real hope. There may be species more intelligent than our *Homo sapiens*. That notion does not really matter, as if there are species much like rhubarb or rabbits, then there is still hope. Life evolves. Maybe, intelligence is not the point of evolution, as Neanderthals are known to have had bigger brains than we modern humans. The Neanderthals are extinct.

20191111 Repeating Shapes in the Cosmos

Viktoro Medrano

My review of the Laniākea Cosmology recently has made me think once again about the shapes of possible life elsewhere in the great, vast universe. Shapes recur everywhere. So, it may be mathematically probable that there could be life shaped like our trees, horses, people, *et cetera* in other parts of the universe. There is repetition of shapes. Exobiology interests me a great deal.

My imagination often entails attractive, exciting **blue**-skinned and **green**-skinned people on a different world. Maybe, my imagined world *really* exists very far, far away.

Is our kind of life or biology shared beyond our Earth, maybe due to *panspermia*? Are there wholly different kinds of life or biology out there? Would there be similar formulations out there?

I imagine also an *afterlife* experience, wherein I am just a kind of light amongst other lights floating around in a different universe.

There are probably really strange things beyond the mundane. Many people just wallow in mundanity.
