

1st Aquatilis 23540

The soil here at Mossvale is nutrient-rich, but it lacks certain trace elements that could significantly boost crop yield. I've begun mixing various alchemical compounds to enhance its fertility. Initial results are promising. A few more tests, and we might have a breakthrough!

3rd Aquatilis 23540

I've begun experimenting with different mixtures of fungal spores to enrich the soil. The cavern soil lacks certain nutrients, and the spores could provide what is missing. The purple spores seem the most promising so far.

7th Aquatilis 23540

The mushrooms in the eastern cavern are growing well. They seem to respond positively to the new compost mixture. I'll need to prepare more of the compost to keep up with the demand. The glowcaps are especially vibrant this season.

8th Aquatilis 23540

I've been experimenting with the cave lilies to create a new salve for burns. The initial tests are promising, but I need to refine the extraction process. The herbalists are eager to see the final product.

10th Aquatilis 23540

While digging in the south, I unearthed a curious device. It appears to be some kind of scanner, though its make is unlike anything I've seen before. It seems to react to water sources. I'll need to investigate further. Perhaps this could aid in my research.

15th Aquatilis 23540

The scanner is incredible! It precisely located several underground water sources around the farm. I've been able to identify the purest water to use in my soil enrichment experiments. This could revolutionize our irrigation practices. I must admit, I feel a strange connection to the device, almost as if it's guiding me.

17th Aquatilis 23540

The water from the underground stream needs to be filtered more efficiently. I've set up additional filtration stones near the inlet. The water is crucial for both the crops and the animals. Any contamination could be disastrous.

19th Aquatilis 23540

The lichen-fed beetles are thriving, but I must find a way to increase their reproductive rate. Their chitin is essential for the armourers. Perhaps adding more bioluminescent moss to their diet will help.

25th Aquatilis 23540

I've noticed something peculiar. The scanner's readings sometimes suggest adding certain substances to the water. Initially, I dismissed these thoughts, but they keep resurfacing. Today, I found myself considering adding a few drops of a contaminant to see what would happen. It was a fleeting thought, but concerning nonetheless.

28th Aquatilis 23540

The creeping mold has started to invade the mushroom beds again. I'll need to brew another batch of fungicidal potion. The previous formula worked well, but I think it can be **improved** with some cave worm extract.

31st Aquatilis 23540

Today's harvest was quite bountiful. The bioluminescent berries from the southern grove are ripe and **plentiful**. We'll need to store them properly to avoid spoilage.

The deep-shelter root vegetables also did well; their **resilience** to the rocky soil is impressive.

38th Aquatilis 23540

The thoughts are becoming more frequent. I caught myself considering how small changes to the water composition might affect the soil's **fertility**. It's a disturbing notion, but the potential **benefits** are intriguing. I must resist this impulse.

1st Sylvaris 23540

The scanner's influence is growing **stronger**. I can't stop thinking about those suggestions. Last night, I introduced a small amount of a benign contaminant into one of the water sources. The results were... **interesting**. The plants reacted in unexpected ways, some growing **faster**, others withering. What is happening to me? Why am I doing this?

3rd Sylvaris 23540

There have been more tremors than usual. While they haven't caused any significant damage yet, we need to reinforce the cavern ceilings to prevent collapse. I'll speak with the masons about gathering more stone supports.

8th Sylvaris 23540

I've introduced more contaminants, and the results are **fascinating**. The soil is more **fertile**, but the plants are **changing**. The scanner suggests these changes are **beneficial**, but I know this isn't right. Yet, the results continue to be **overwhelming**. I feel as if I'm on the cusp of something great, something **important**.

15th Sylvaris 23540

My experiments have proven **successful** beyond my wildest dreams. The water, though altered, has made the soil incredibly **fertile**. The animals have **changed** as well, becoming more **docile**, more **controllable**. This is no mere device; it's a guide to a **new world**. I will follow where it leads.

30th Sylvaris 23540

It's clear to me now that this is my **true calling**. The scanner has shown me a **new path**. The water must be **changed**, and the land **transformed**. I've begun to manipulate the fauna as well. They **obey** my commands, and I see the potential in this **power**. The farm will become a **beacon** of this **new order**.
There is no hesitation now, only **purpose**.

3rd Lunaris 23540

The Hydro-Scanner detected a **significant** water source beneath the south field. The purity levels are **remarkable**. I've begun redirecting some of the flow to the main irrigation system. This could be the key to our **future** success here.

4th Lunaris 23540

Preparations for the **Harvest Festival** are underway. They've decorated the main cavern with bioluminescent vines and fungi. Everyone is looking forward to the **feast** and the storytelling.
I must remember to prepare my **special** stew for the occasion.
